## DESCRIPTION

High common mode transient immunity and very high current ratio together with 5300 V<sub>RMS</sub> insulation are achieved by coupling an LED with an integrated high gain photo detector in an eight pin dual-in-line package. Separate pins for the photo diode and output stage enable TTL compatible saturation voltages with high speed operation.

Access to the base terminal allows adjustment to the gain bandwidth.

The 6N138 is ideal for TTL applications since the 300 % minimum current transfer ratio with an LED current of 1.6 mA enables operation with one unit load-in and one unit load-out with a 2.2 kΩ pull-up resistor.

The 6N139 is best suited for low power logic applications involving CMOS and low power TTL. A 400 % current transfer ratio with only 0.5 mA of LED current is guaranteed from 0 °C to 70 °C.

**Caution:** Due to the small geometries of this device, it should be handled with Electrostatic Discharge (ESD) precautions. Proper grounding would prevent damage further and/or degradation which may be induced by ESD.

COMMON MODE TRANSIENT IMMUNITY							
PARAMETER	TEST CONDITION	PART	SYMBOL	MIN.	TYP.	MAX.	UNIT
Common mode transient immunity, logic high level output (1)(2)	$I_F = 0 \text{ mA}$ , $R_L = 2.2 \text{ k}\Omega$ , $R_{CC} = 0$ , $ V_{CM}  = 10 \text{ V}_{P-P}$		$ CM_H $		500		V/ $\mu$ s
Common mode transient immunity, logic low level output (1)(2)	$I_F = 16 \text{ mA}$ , $R_L = 2.2 \text{ k}\Omega$ , $R_{CC} = 0$ , $ V_{CM}  = 10 \text{ V}_{P-P}$		$ CM_L $		- 500		V/ $\mu$ s

#### Notes

- (1) Common mode transient immunity in logic high level is the maximum tolerable (positive)  $dV_{CM}/dt$  on the leading edge of the common mode pulse,  $V_{CM}$ , to assure that the output will remain in a logic high state (i.e.  $V_O > 2 \text{ V}$ ) common mode transient immunity in logic low level is the maximum tolerable (negative)  $dV_{CM}/dt$  on the trailing edge of the common mode pulse signal,  $V_{CM}$  to assure that the output will remain in a logic low state (i.e.  $V_O < 0.8 \text{ V}$ ).
- (2) In applications where  $dV/dt$  may exceed 50 000 V/ $\mu$ s (such as state discharge) a series resistor,  $R_{CC}$  should be included to protect  $I_C$  from destructively high surge currents. The recommend value is  $R_{CC} \equiv [(1 \text{ V})/(0.15 I_F (\text{mA}))] \text{ k}\Omega$
