

LA4425A

Monolithic Linear IC

5W Power Amplifier with Very Few External Parts for Car Radio and Car Stereo

ON Semiconductor®

<http://onsemi.com>

Overview

The LA4425A is a 5W power amplifier with very few external parts. The smallest package in the industry [SIP-5H(TO-126 type)]. Only two external parts (Only I/O coupling capacitors). Almost no evaluation, adjustment and check of its functions as a power IC required and simplified control

Functions

- Wide operation supply range → 5 to 16V
- On-chip protection:
 - Over-voltage protection
 - Thermal protection
 - Output D.C. short protection .
- On-chip pop noise reducing circuit

Specifications

Maximum Ratings at Ta = 25°C

| Parameter | Symbol | Conditions | Ratings | Unit |
|------------------------------|-----------------------|------------------------------------|-------------|------|
| Maximum supply voltage | V _{CC} max | R _g = 0 | 18 | V |
| Surge maximum supply voltage | V _{CC} surge | Giant pulse 200ms Rise time 1ms | 50 | V |
| Maximum output current | I _O peak | | 3.3 | A |
| Allowable power dissipation | P _d max | With infinite heat sink | 7.5 | W |
| Operating temperature | T _{opr} | | -30 to +80 | °C |
| Storage temperature | T _{stg} | | -40 to +150 | °C |

Stresses exceeding Maximum Ratings may damage the device. Maximum Ratings are stress ratings only. Functional operation above the Recommended Operating Conditions is not implied. Extended exposure to stresses above the Recommended Operating Conditions may affect device reliability.

LA4425A

Operating Conditions at $T_a = 25^\circ\text{C}$,

| Parameter | Symbol | Conditions | Ratings | Unit |
|---------------------------------|--------------------|---|---------|------|
| Recommended supply voltage | V _{CC} | | 13.2 | V |
| Recommended load resistance | R _L | | 4 | Ω |
| Operating voltage range | V _{CC op} | | 5 to 16 | V |
| Operating load resistance range | R _{L op} | Under conditions where maximum ratings are not exceeded | 2 to 8 | Ω |

Electrical Characteristics at $T_a = 25^\circ\text{C}$, $V_{CC} = 13.2\text{V}$, $R_L = 4\Omega$, $f = 1\text{ kHz}$, $R_g = 600\Omega$,
specified board/specifyed circuit, $30 \times 30 \times 1.5\text{mm}^3$ thick aluminum used

| Parameter | Symbol | Conditions | Ratings | | | Unit |
|-------------------------------|------------------|---|---------|------|-----|------|
| | | | min | typ | max | |
| Quiescent current | I _{CC0} | | | 65 | 130 | mA |
| Voltage gain | V _G | V _O = 0dBm | 43 | 45 | 47 | dB |
| Output power | P _{O1} | 13.2 V / 4Ω, THD = 10% | 4 | 5 | | W |
| | P _{O2} | 14.4 V / 4Ω, THD = 10% | 5 | 6 | | W |
| Total harmonic distortion | THD | V _O = 2V | | 0.1 | 1.0 | % |
| Output noise voltage | V _{NO} | R _g = 0, BPF = 20 Hz to 20 kHz | 30 | 40 | | dB |
| Ripple rejection ratio | SVRR1 | R _g = 0, BPF = 20 Hz to 20 kHz V _R = 0dBm, f _R = 100Hz | 30 | 40 | | dB |
| | SVRR2 | R _g = 0, BPF = 20 Hz to 20 kHz V _R = 0dBm, f _R = 100 Hz | | 47 | | dB |
| Over-voltage attack | V _{CCX} | R _g = 0 | | 21.5 | | V |
| Starting time | t _S | | | 0.35 | | s |
| Input resistance | R _{IN} | | | 50 | | kΩ |
| Roll-off frequency | f _L | | | 40 | | Hz |
| | f _H | | | 90 | | kHz |
| Thermal operating temperature | T _c | | | 125 | | °C |

Package Dimensions

unit : mm (typ)

3031C

Sample Application Circuit

- On-chip overvoltage protection
- On-chip thermal protection
- On-chip pop noise reducing circuit
- On-chip output D.C. short protection

Pin Voltage at $V_{CC} = 13.2V$

| Characteristics | Input | Small signal GND | Large signal GND | Output | V_{CC} |
|-------------------------------|-------------------------------|------------------|------------------|---------------------------------|-----------------------|
| Pin No. | 1 | 2 | 3 | 4 | 5 |
| Pin voltage (reference value) | ($\approx 2V_{BE}$) 1.4V | 0V | 0V | ($\approx 1/2V_{CC}$) 6.5V | (V_{CC}) 13.2V |

IC Usage Notes

Maximum ratings

If the IC is used in the vicinity of the maximum ratings, even a slight variation in conditions may cause the maximum ratings to be exceeded, thereby leading to a breakdown.

Printed circuit board

When drawing the printed circuit pattern, refer to the sample printed circuit pattern. Be careful not to form a feedback loop between input and output.

Comparison of External Components

| External Parts | Our ICs now in use | LA4425A |
|---|--------------------|---------|
| Output coupling capacitor | ○ | ○ |
| Input coupling capacitor | ○ | ○ |
| Bootstrap capacitor | ○ | - |
| Feedback capacitor | ○ | - |
| Filter capacitor | ○ | - |
| Phase compensation capacitor | ○ | - |
| Oscillation correction polyester film capacitor | ○ | - |
| Oscillation correction resistor | ○ | - |
| Total | 8 pcs. | 2 pcs. |

Note: The power supply capacitor is not counted as a power IC part.

LA4425A

Sample Printed Circuit Pattern

LA4425A

Instructions and Precautions

- Connect a capacitor of 1000pF across pins ① and ② for external disturbance path.
- Be careful of the ground line artwork when laying out the printed circuit pattern. Arrange so that the Sg route and load current flow-in route do not overlap. Refer to the recommended printed circuit pattern or make slits, etc. at pins ② and ③.

DUAL Printed Circuit Pattern Example

- Short Circuit Tests

Our company's recommended printed circuit board: Apply V_{CC}=13.2V using a 30x30x1.5mm³ thick aluminum board. The IC will be protected from the DC/AC shorting of switches 1 to 4 above. However, be careful not to damage the IC by turning V_{CC} "ON" when DC short (SW 1 or SW 2) is on.

- Power Supply Positive Surge

The over-voltage protector ($V_{CCX} \approx 21.5V$) inside the IC is used to cut all bias routes and reverse bias between B-E of output stage elements, in order to increase the power line's capability of handling positive surge. This means, of course, that a V_{CES} (V_{CBO}) type output stage element is used instead of the V_{CEO} (V_{CER}) type.

LA4425A

- Load Resistance and Misoperation

It should be noted that when $R_L < 2\Omega$ and V_{CC} is high, and the switch is turned “ON” when setting is for a signal (THD = 10%), the ground detector (current \times voltage Schmitt circuit) operates momentarily.

- Precautions on TaB

If power voltage is applied to the IC substrate (the heat sink on a set), the IC structure is such that the PN junctions may be burned, causing deterioration or destruction. Consult Our company’s Quality Assurance Department with regard to the energy handling capability (voltage peak value, pulse width). Also, the IC TaB (substrate) is connected to pin 3, large signal GND.

- Test of $+V_{CC}$ to Output Pin

The power pin is in a floating state when a power capacitor is connected, so if $+V_{CC}$ touches output lines ① and ②, the upper power transistor inside the IC will be damaged.

The LA4425A has a protective bypass route inside the IC.

- Starting Time (t_s)

This is set at 0.35sec/typ, but it can be made shorter by making input capacitor C_i smaller, or longer by making it larger.

- Pop noise

The pop noise prevention circuit operates to reduce pop until R_g reaches $50k\Omega$. However, if R_g is left open, the charging route of input capacitor C_i is lost, so the pop noise reduction circuit stops operating and click noises become louder.

- VG/OSC

The voltage gain is fixed at 45dB inside the IC. It is impossible to change it externally.

Phase compensation capacitors (350pF/total) are connected between individual stages inside the IC, and the open loop gain is low. In addition, the upper and lower drives are made equivalent so that final stage current gain is adjusted, providing a measure against unwanted high-frequency parasitic oscillation peculiar to power IC’s.

- BTL Connection

Connection is impossible with IC alone.

- Reverse Mounting of IC

The pin assignment is such that there is no danger of damage.

- T.S.D (Thermal Shutdown) Operating Temperature

T.S.D is capable of starting operation at Tc 120 to 130°C. When this is converted to junction temperature (Tj) according to the formula below.

$$T_j \approx 165C,$$

$$T_j = Q_{jc} \cdot P_d + T_c$$

As T.S.D operation progresses, the output pin bias voltage drops, and it becomes harder to drive the upper waveform. Therefore, the current (I_{CC}) and power (P_O) show a tendency to decrease.

Proper Cares in Mounting Radiator Fin

1. The mounting torque is in the range of 1. The mounting torque is in the range of 39 to 59 N·cm.
2. The distance between screw holes of the radiator fin must coincide with the distance between screw holes of the IC.
3. The screw to be used must have a head equivalent to the one of truss machine screw or binder machine screw defined by JIS. Washers must be also used to protect the IC case.
4. No foreign matter such as cutting particles shall exist between heat sink and radiator fin. When applying grease on the junction surface, it must be applied uniformly on the whole surface.
5. Because the heat sink mounting tab and the heat sink are at the same electric potential as the chip's GND, care must be taken when mounting the heat sink on more than one device.
6. IC lead pins are soldered to the printed circuit board after the radiator fin is mounted on the IC.
